Intramedullary Nails – Demo

Femoral, tibial, humeral and pediatric IM nails.

Antegrade Femoral Interlocking Nail

A cannulated, closed-section titanium nail for antegrade fixation of femoral shaft fractures, engineered with an anatomic mediolateral bow and anti-rotation locking for rotational stability.

Read online

Retrograde Femoral Nail

Designed for retrograde insertion through the intercondylar notch, ideal for distal femoral, periprosthetic and polytrauma fractures where antegrade access is unsuitable.

Read online

Tibia Interlocking Nail

A proximal-bend tibial nail with multiplanar proximal locking for the full spectrum of tibial shaft and metaphyseal fractures, including suprapatellar insertion.

Read online

Humerus Interlocking Nail

A low-profile humeral nail for proximal, shaft and combined humeral fractures, with a rounded proximal end that minimises rotator-cuff irritation.

Read online

Proximal Femoral Nail (PFN)

A two-screw cephalomedullary nail for pertrochanteric and subtrochanteric femoral fractures, providing controlled compression across the fracture with anti-rotation support.

Read online

Proximal Femoral Nail Anti-Rotation (PFNA)

A single helical-blade cephalomedullary nail that compacts cancellous bone for superior purchase in osteoporotic pertrochanteric fractures.

Read online

Gamma-Type Trochanteric Nail

A short trochanteric nail with a large-diameter lag screw for stable and unstable intertrochanteric fractures, allowing early weight bearing.

Read online

Expert Suprapatellar Tibial Nail

Optimised for semi-extended suprapatellar insertion, extending intramedullary fixation to very proximal and very distal tibial fractures.

Read online

Reconstruction Femoral Nail

A reconstruction nail with two cephalic screws directed into the femoral neck for ipsilateral neck-and-shaft fractures and pathological lesions.
