Plates & Fixators – Demo

Locking compression plates, DHS/DCS, anatomical plates.

Dynamic Hip Screw (DHS) Plate

The gold-standard sliding hip screw for stable intertrochanteric and femoral neck fractures, allowing controlled fracture impaction under load.

Read online

Dynamic Condylar Screw (DCS) Plate

A fixed 95° condylar screw-and-plate construct for distal femoral and subtrochanteric fractures requiring rigid angular stability.

Read online

Proximal Humerus Locking Plate (PHILOS)

An anatomically contoured proximal humerus plate with a divergent locking-screw array and suture holes for two-, three- and four-part fractures.

Read online

Distal Femur Locking Plate (LISS)

A lateral distal femur plate designed for minimally invasive submuscular insertion (MIPO), acting as an internal fixator for comminuted supracondylar fractures.

Read online

Proximal Tibia Locking Plate

An anatomic lateral tibial plateau plate supporting the articular surface with a raft of subchondral locking screws for split-depression fractures.

Read online

Distal Radius Volar Locking Plate

A low-profile volar plate for distal radius fractures with a variable-angle distal row that lets the surgeon aim subchondral pegs beneath the articular surface.

Read online

Reconstruction Plate

A notched plate that can be bent and twisted in three planes for pelvic, acetabular, clavicle and periarticular fractures with complex geometry.

Read online

One-Third Tubular Plate

A thin, low-profile plate for lateral malleolus, olecranon and other subcutaneous locations where soft-tissue coverage is limited.

Read online

Clavicle Locking Plate

A superior, anatomically pre-contoured clavicle plate for displaced midshaft and lateral clavicle fractures, reducing the need for intra-operative bending.

Read online

Calcaneal Locking Plate

A perimeter calcaneal plate that supports the posterior facet and tuberosity in displaced intra-articular calcaneal fractures via a lateral extensile or sinus-tarsi approach.
